

ABSTRACT OF THE DISCLOSURE

A pole ring particularly suitable for d.c. motors comprises several retaining projections (34,36) provided at the outer circumference (32) for the secure retainment in a motor housing (10). The retaining projections (34,36) comprise retaining surfaces (40) pointing oppositely to the mounting direction (38). Fixing is effected via the retaining surfaces (40) in a housing (10) made of a soft material, such as aluminum diecasting or plastic, for example.
